

### 123-Frozen Construction

The Ice Castle building is designed as a visually striking and immersive structure inspired by ice-themed architecture. The construction focuses on creating a castle-like form with towers, arches, and decorative elements that resemble natural ice formations while ensuring structural safety and durability. The building will be constructed using high-quality, weather-resistant materials such as reinforced concrete and steel for the main structure, combined with specialized translucent and textured finishes to create an ice-like appearance. Interior and exterior surfaces will feature cool-tone lighting and reflective elements to enhance the frozen castle effect. The project includes visitor-friendly pathways, staircases, and viewing areas, designed with non-slip flooring and safety railings. Proper insulation, ventilation, and temperature control systems will be installed to maintain comfort and protect materials. Emergency exits, fire safety systems, and accessibility features will be incorporated as per safety regulations.
